

BRIEF EXPLANATION OF PROJECT

- I did a food outlets rating system in my project.
- I have 4 tables in the database. I used PostgreSQL database in my project.
- I used Maven to get the Hibernate technology.
- I have a "hibernate.cfg.xml" file inside of the Resources folder which deals with database connection.
- I used a PostgreSQL database, so I needed to add a .jar file to the IntelliJ, by Project Structure > Modules > Dependencies > add Jar file.(It's in the main project directory.)
- I have a class(SessionFactorySingleton) for getting hibernate configuration.
- I have two classes(OutletDao and RegisterUserDao) for making CRUD operations.
- I'm doing CRUD operations in 4 tables(et_user,et_restauran,et_bistro,et_take_away).
- I have a super class(Outlet) which inherits the Restaurant, Bistro and TakeAway classes.
- I have a method inside of the Main class(loadSampleFileToDb) which imports the sample userInfo file to the database.
- After finalising the project I see that my Main class is a little bit spaghetti, sorry for that.
